

Layering in Networked computing

- OSI Model
- TCP/IP Model
- Protocols at each layer

Learning outcomes

- Understand the need of layering in Networked computing
- Understand the OSI model and the tcp/ip model
 - Understand the function protocols and their role at each layer.
 - TCP protocol
 - UDP protocol
- Understand the role of header in communication between layers
- Understand how data sent from one host arrive to the target host.

What is layering in Networked computing?

- Breaks down communication into smaller, simpler parts.

Why a layered model?

- Easier to teach communication process.
- Speeds development, changes in one layer does not affect how the other levels works.
- Standardization across manufactures.
- Allows different hardware and software to work together
- Reduces complexity

The OSI Reference Model

OSI

The OSI Model

- OSI “Open Systems Interconnection”.
- OSI model was first introduced in 1984 by the International Organization for Standardization (ISO).
 - Outlines **WHAT** needs to be done to send data from one computer to another.
 - Not **HOW** it should be done.
 - Protocols stacks handle how data is prepared for transmittal (to be transmitted)
- In the OSI model, The specification needed
 - are contained in 7 different layers that interact with each other.

What is “THE MODEL?”

- Commonly referred to as the OSI reference model.
- The OSI model
 - is a theoretical blueprint that helps us understand how data gets from one user's computer to another.
 - It is also a model that helps develop standards so that all of our hardware and software talks nicely to each other.
 - It aids standardization of networking technologies by providing an organized structure for hardware and software developers to follow, to insure their products are compatible with current and future technologies.

7 Layer OSI Model

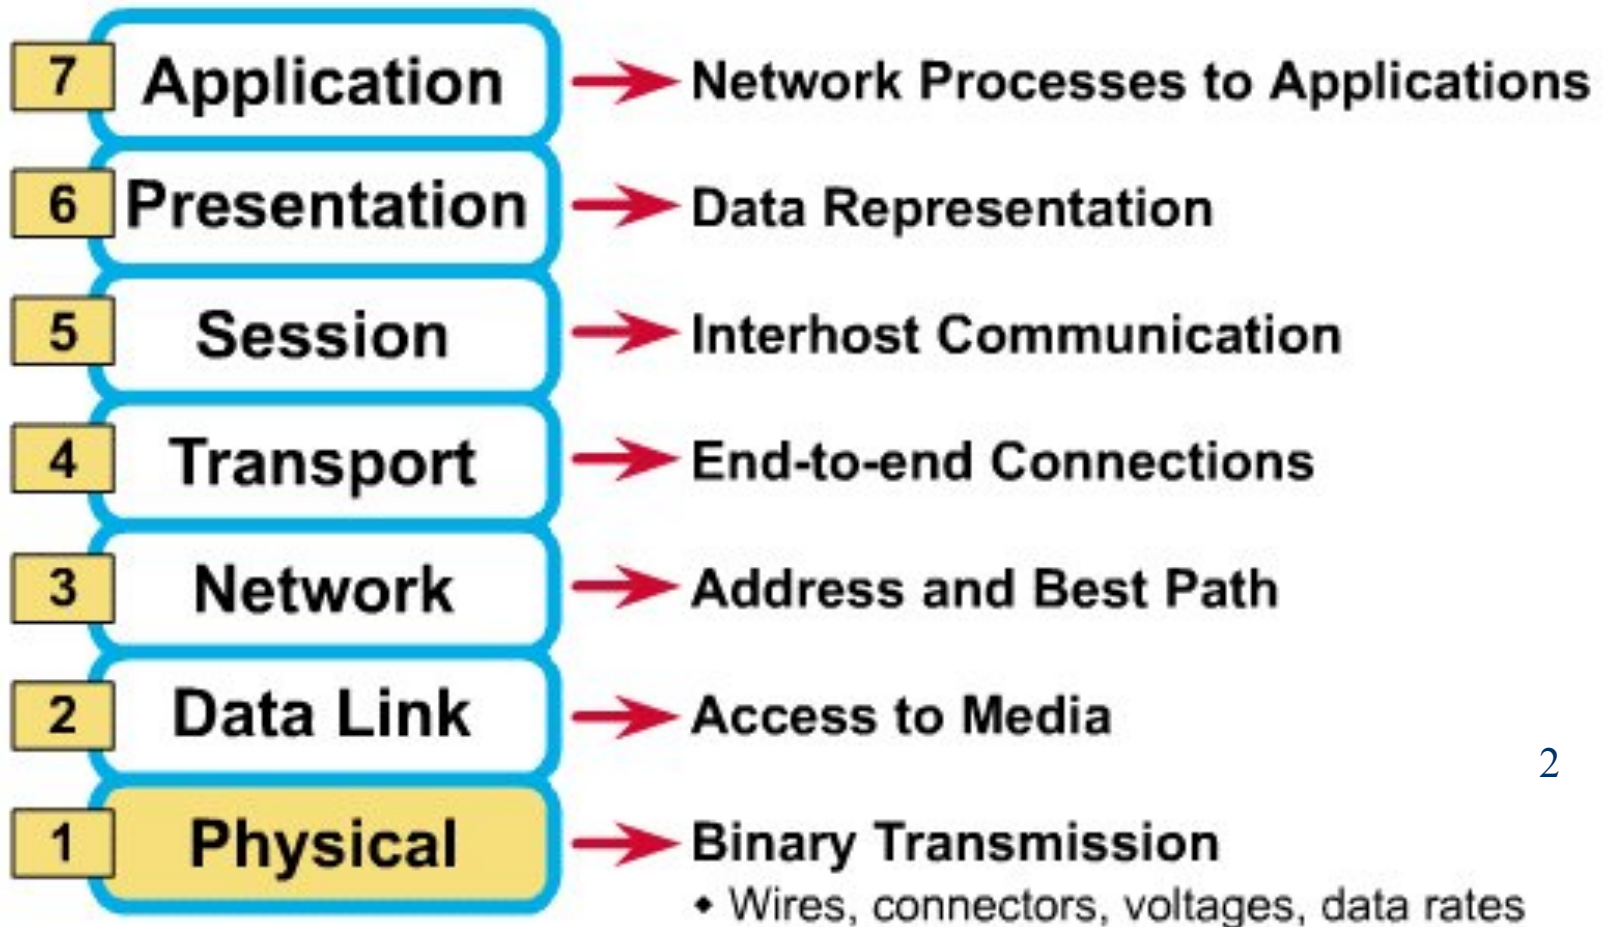

- Why use a reference model?
 - Serves as an outline of rules for how protocols can be used to allow communication between computers.
 - Each layer has its own function and provides support to other layers.
- Other reference models are in use.
 - Most well known is the TCP/IP reference model.
 - We will compare OSI and TCP/IP models
- As computing requirements increased, the network modeling had to evolve to meet ever increasing demands of larger networks and multiple vendors.
- Problems and technology advances also added to the demands for changes in network modeling.

Evolution of the 7-Layers

- Single Layer Model - First Communication Between Computer Devices
 - Dedicated copper wire or radio link
 - Hardware & software inextricably intertwined
 - Single specification for all aspects of communication

What Each Layer Does

The 7 Layers of the OSI Model

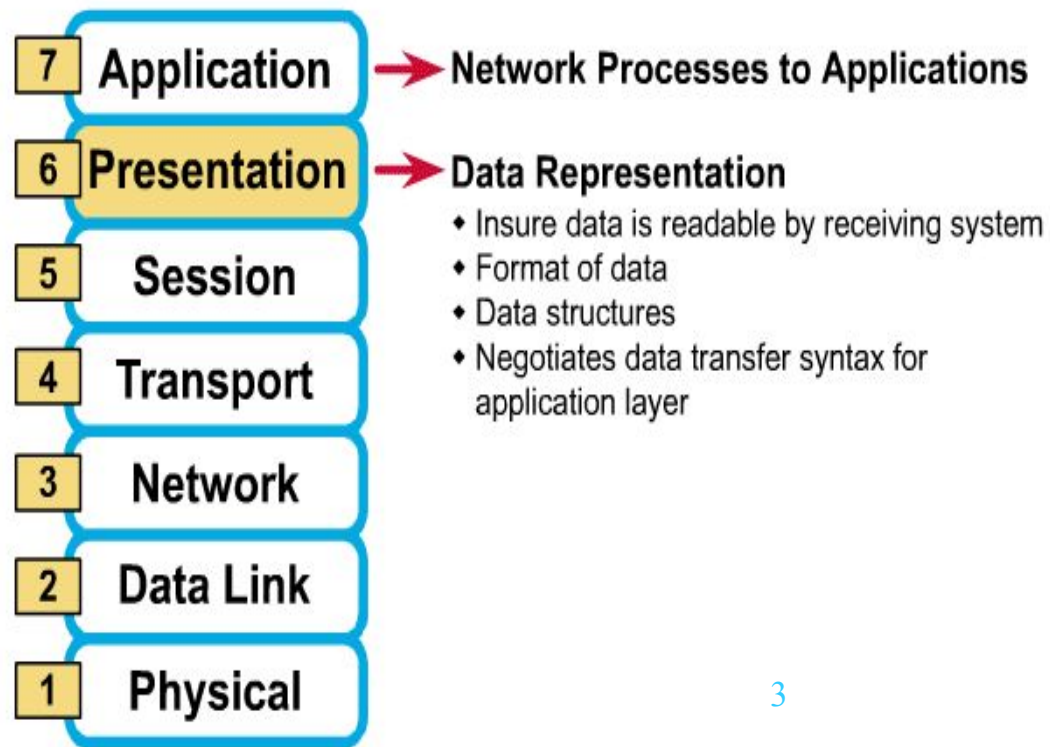

→ **Network Processes to Applications**

- ♦ Provides network services to application processes (such as electronic mail, file transfer, and terminal emulation)

- Gives end-user applications access to network resources
- Where is it on my computer?
 - Workstation or Server Service in MS Windows

Presentation Layer

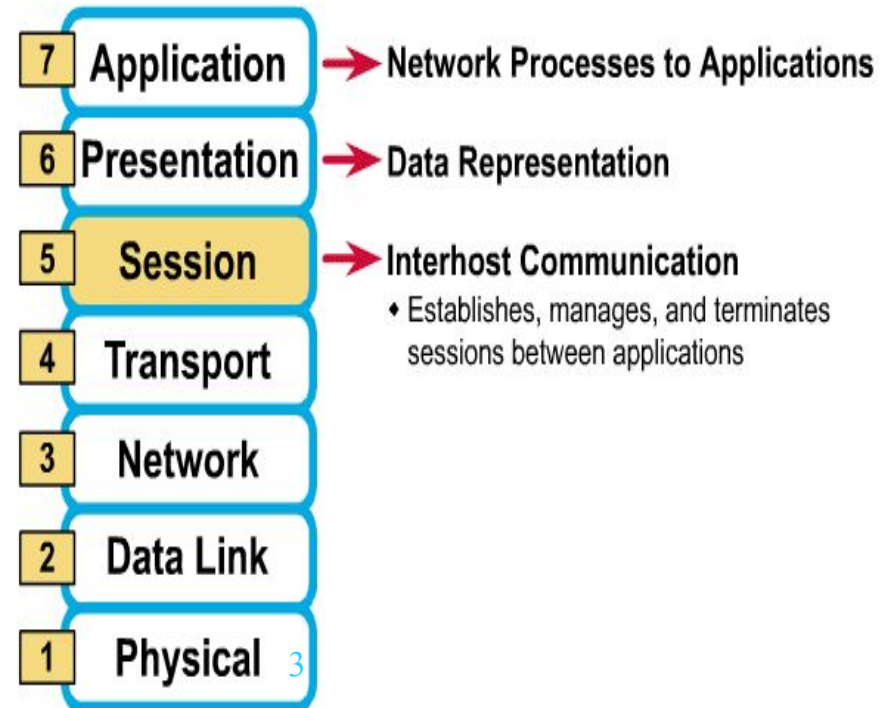

The 7 Layers of the OSI Model

Session Layer

- Allows applications to maintain an ongoing session
- Where is it on my computer?
 - Workstation and Server Service (MS)
 - Windows Client for NetWare (NetWare)

The 7 Layers of the OSI Model

Transport Layer

- Provides reliable data delivery
- It's the TCP in TCP/IP
- Receives info from upper layers and segments it into packets
- Can provide error detection and correction

The 7 Layers of the OSI Model

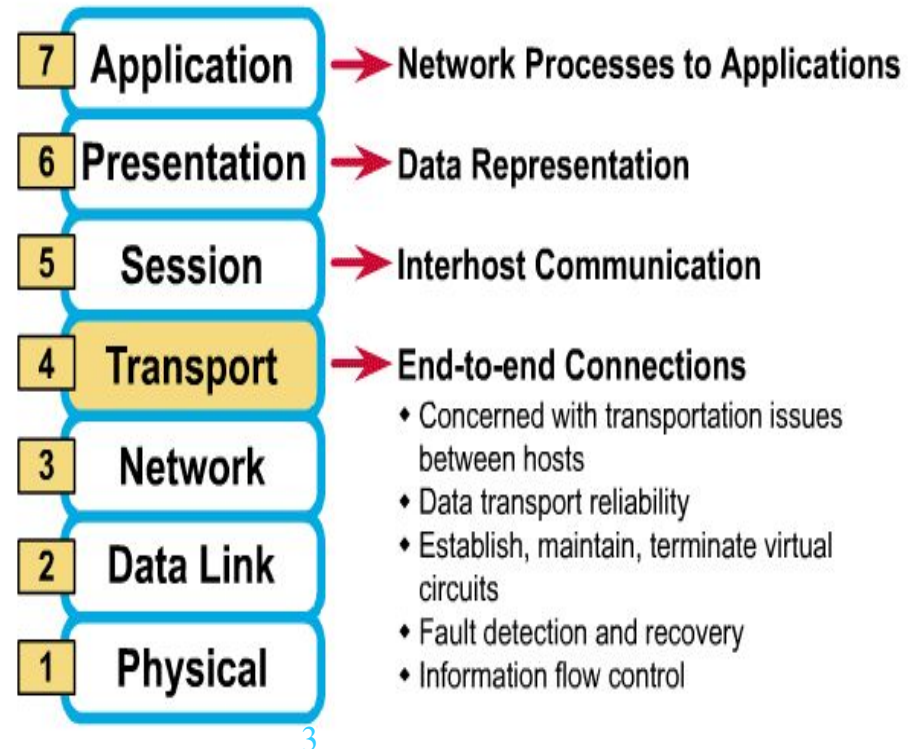

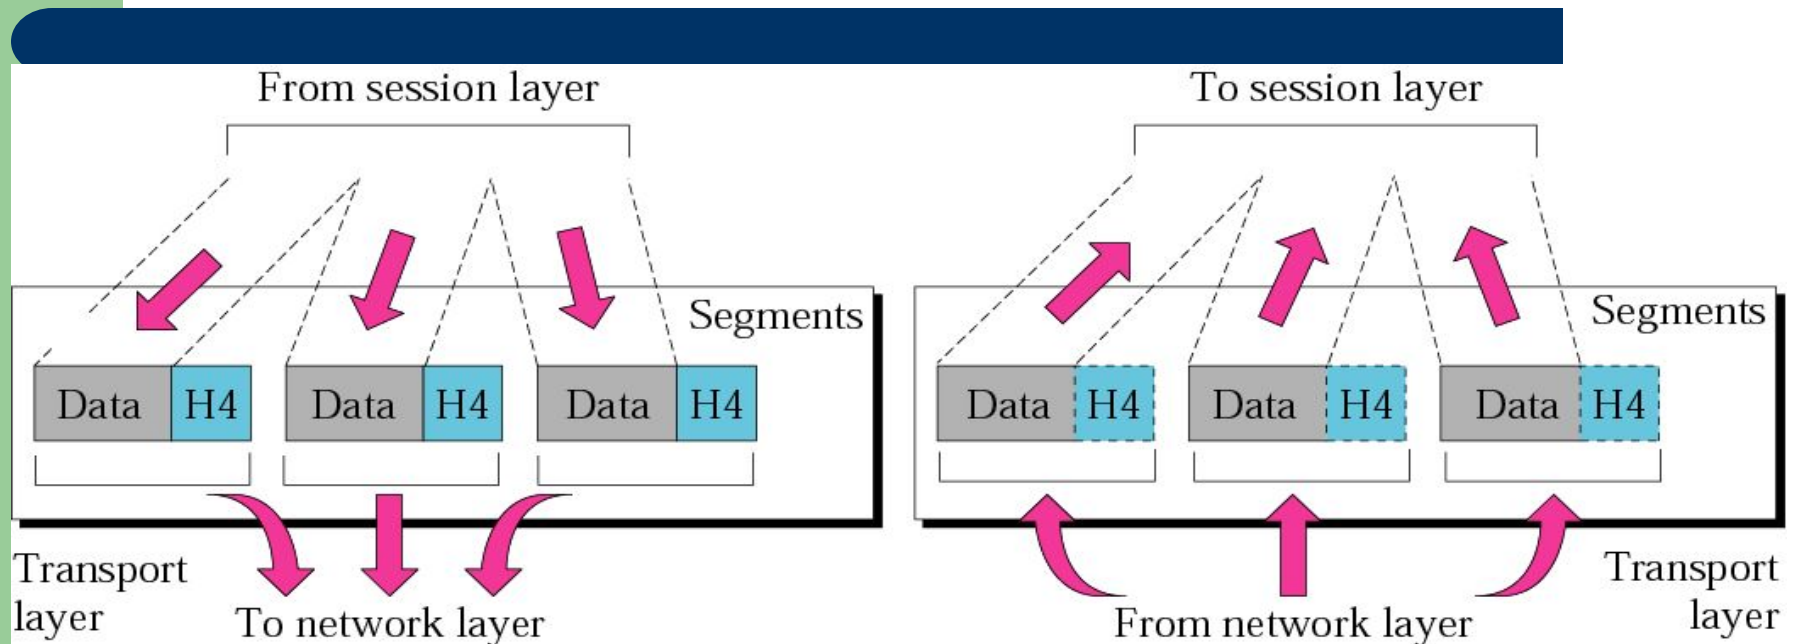

Figure 2.9 *Transport layer*

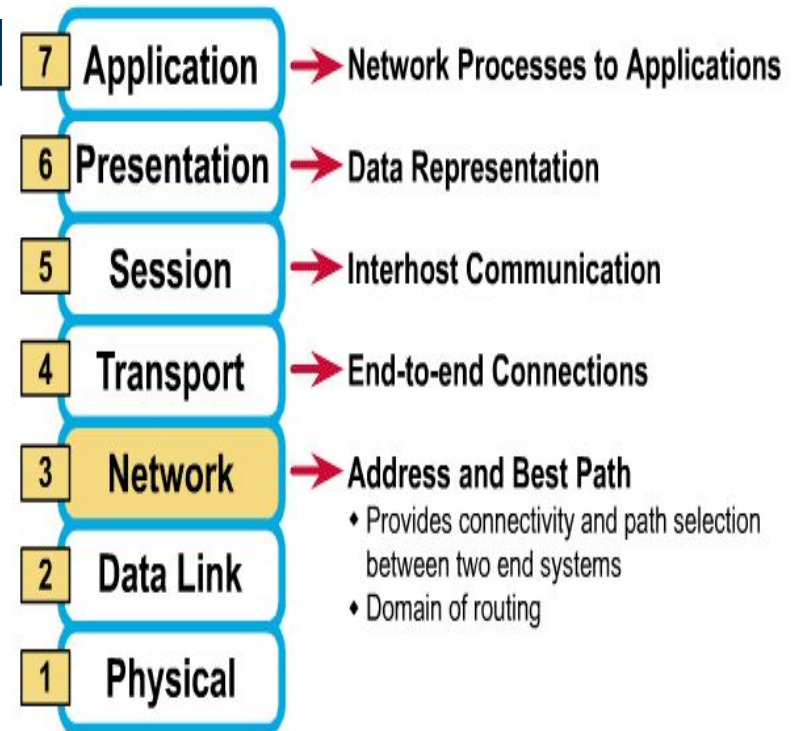

The transport layer is responsible for the delivery of a message from one process to another.

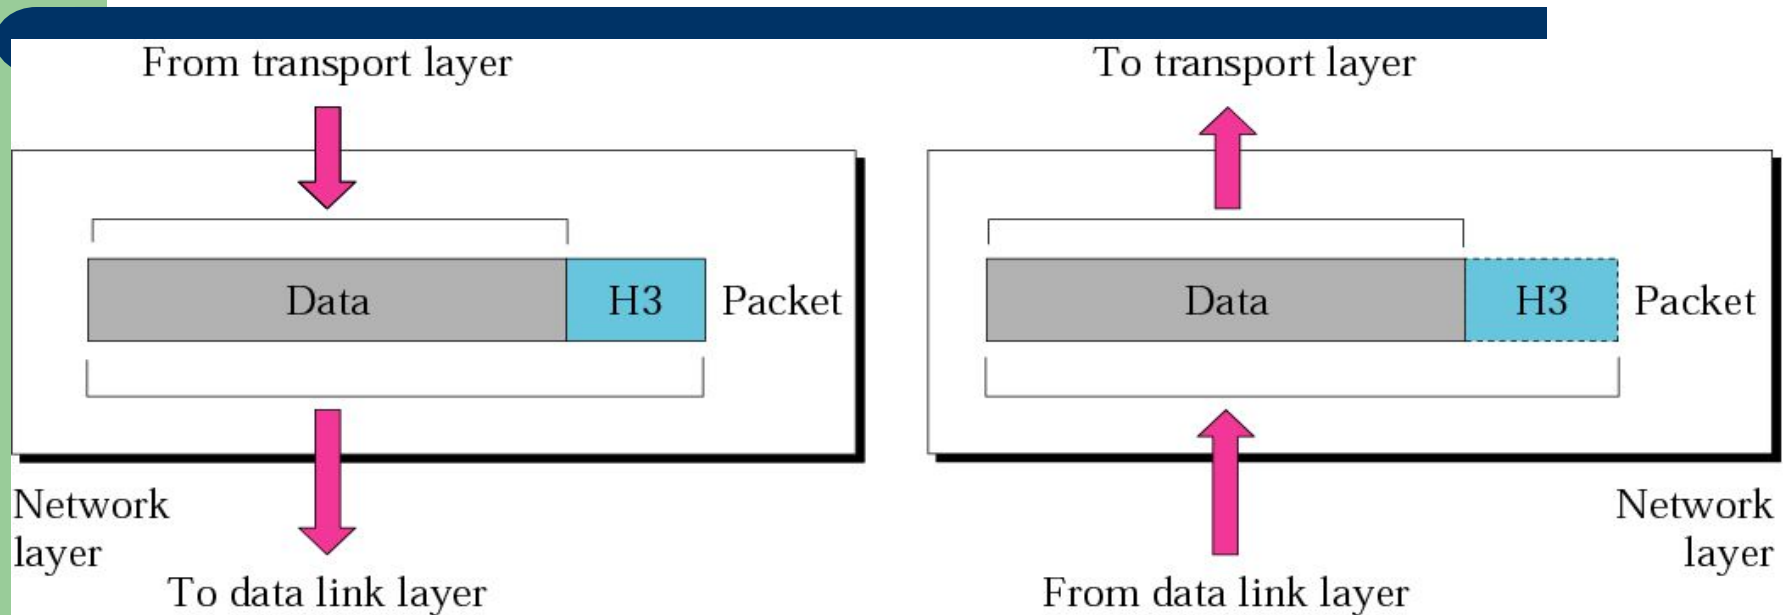

Network Layer

- Provides network-wide addressing and a mechanism to move packets between networks (routing)
- Responsibilities:
 - Network addressing
 - Routing
- Example:
 - IP from TCP/IP

The 7 Layers of the OSI Model

Network layer

The network layer is responsible for the delivery of individual packets from the source host to the destination host.

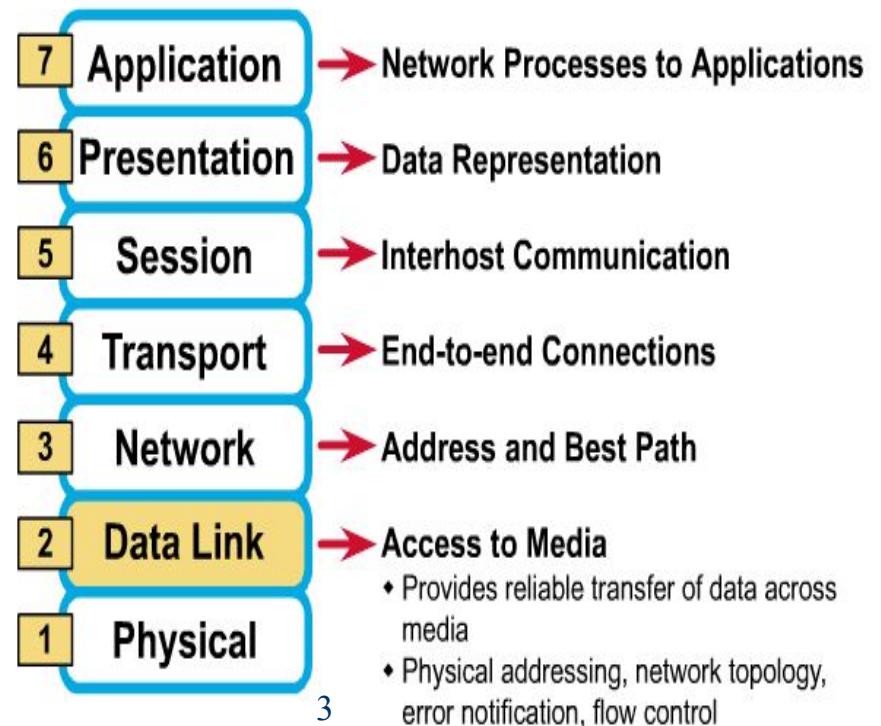

Network Addresses

- Network-wide addresses
- Used to transfer data across subnets
- Used by routers for packet forwarding
- Example:
 - IP Address
- Where is it on my computer?
 - TCP/IP Software

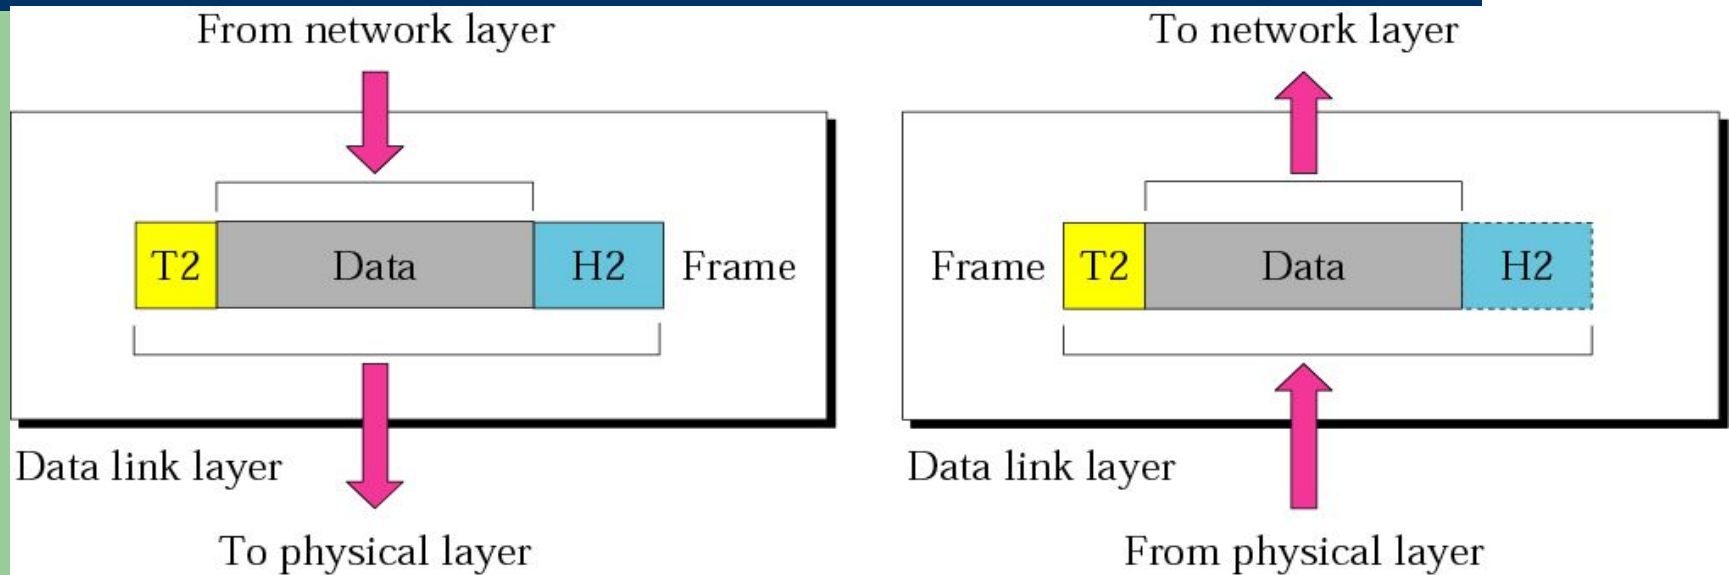

Data Link Layer

- Places data and retrieves it from the physical layer and provides error detection capabilities

The 7 Layers of the OSI Model

Data link layer

The data link layer is responsible for moving frames from one hop (node) to the next.

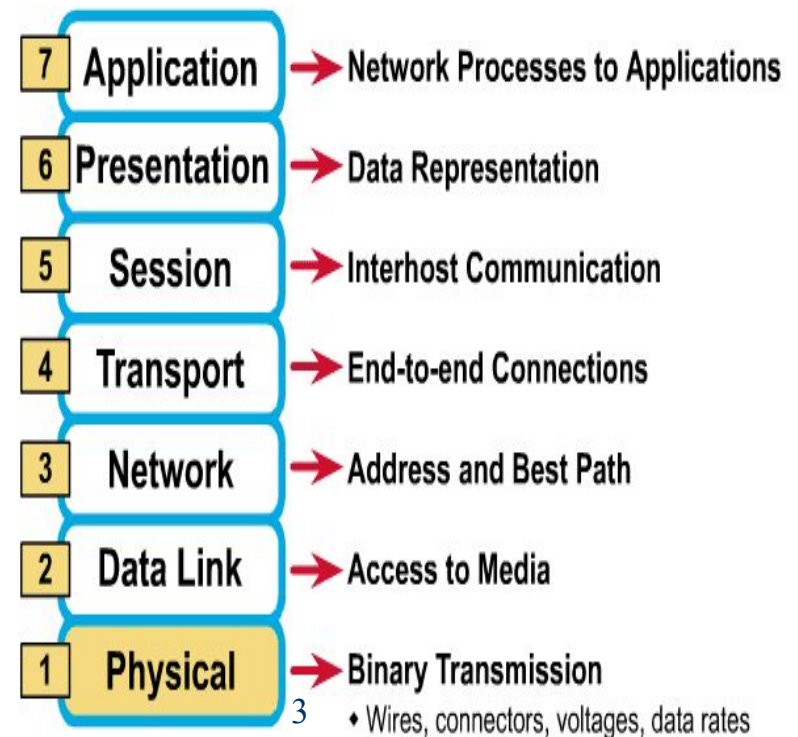

Sub-layers of the Data Link Layer

- MAC (Media Access Control)
 - Gives data to the NIC
 - Controls access to the media through:
 - CSMA/CD Carrier Sense Multiple Access/Collision Detection
 - Token passing
- LLC (Logical Link Layer)
 - Manages the data link interface (or Service Access Points (SAPs))
 - Can detect some transmission errors using a Cyclic Redundancy Check (CRC). If the packet is bad the LLC will request the sender to resend that particular packet.

Physical Layer

- Determines the specs for all physical components
 - Cabling
 - Interconnect methods (topology / devices)
 - Data encoding (bits to waves)
 - Electrical properties
- Examples:
 - Ethernet (IEEE 802.3)
 - Token Ring (IEEE 802.5)
 - Wireless (IEEE 802.11b)

The 7 Layers of the OSI Model

Physical layer

The physical layer is responsible for the movement of individual bits from one hop (node) to the next.

Physical Layer (cont'd)

- What are the Physical Layer components on my computer?
- NIC
 - Network Interface Card
 - Has a unique 12 character Hexadecimal number permanently burned into it at the manufacturer.
 - The number is the MAC Address/Physical address of a computer
- Cabling
 - Twister Pair
 - Fiber Optic
 - Coax Cable

How Does It All Work Together

- Each layer contains a Protocol Data Unit (PDU)
 - PDU's are used for peer-to-peer contact between corresponding layers.
 - Data is handled by the top three layers, then Segmented by the Transport layer.
 - The Network layer places it into packets and the Data Link frames the packets for transmission.
 - Physical layer converts it to bits and sends it out over the media.
 - The receiving computer reverses the process using the information contained in the PDU.

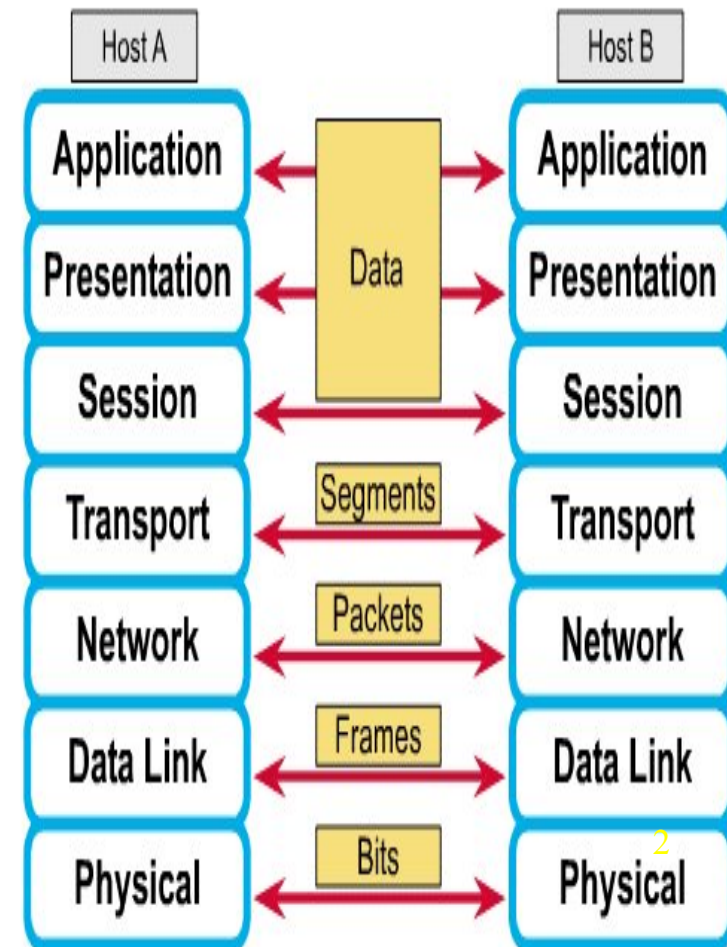

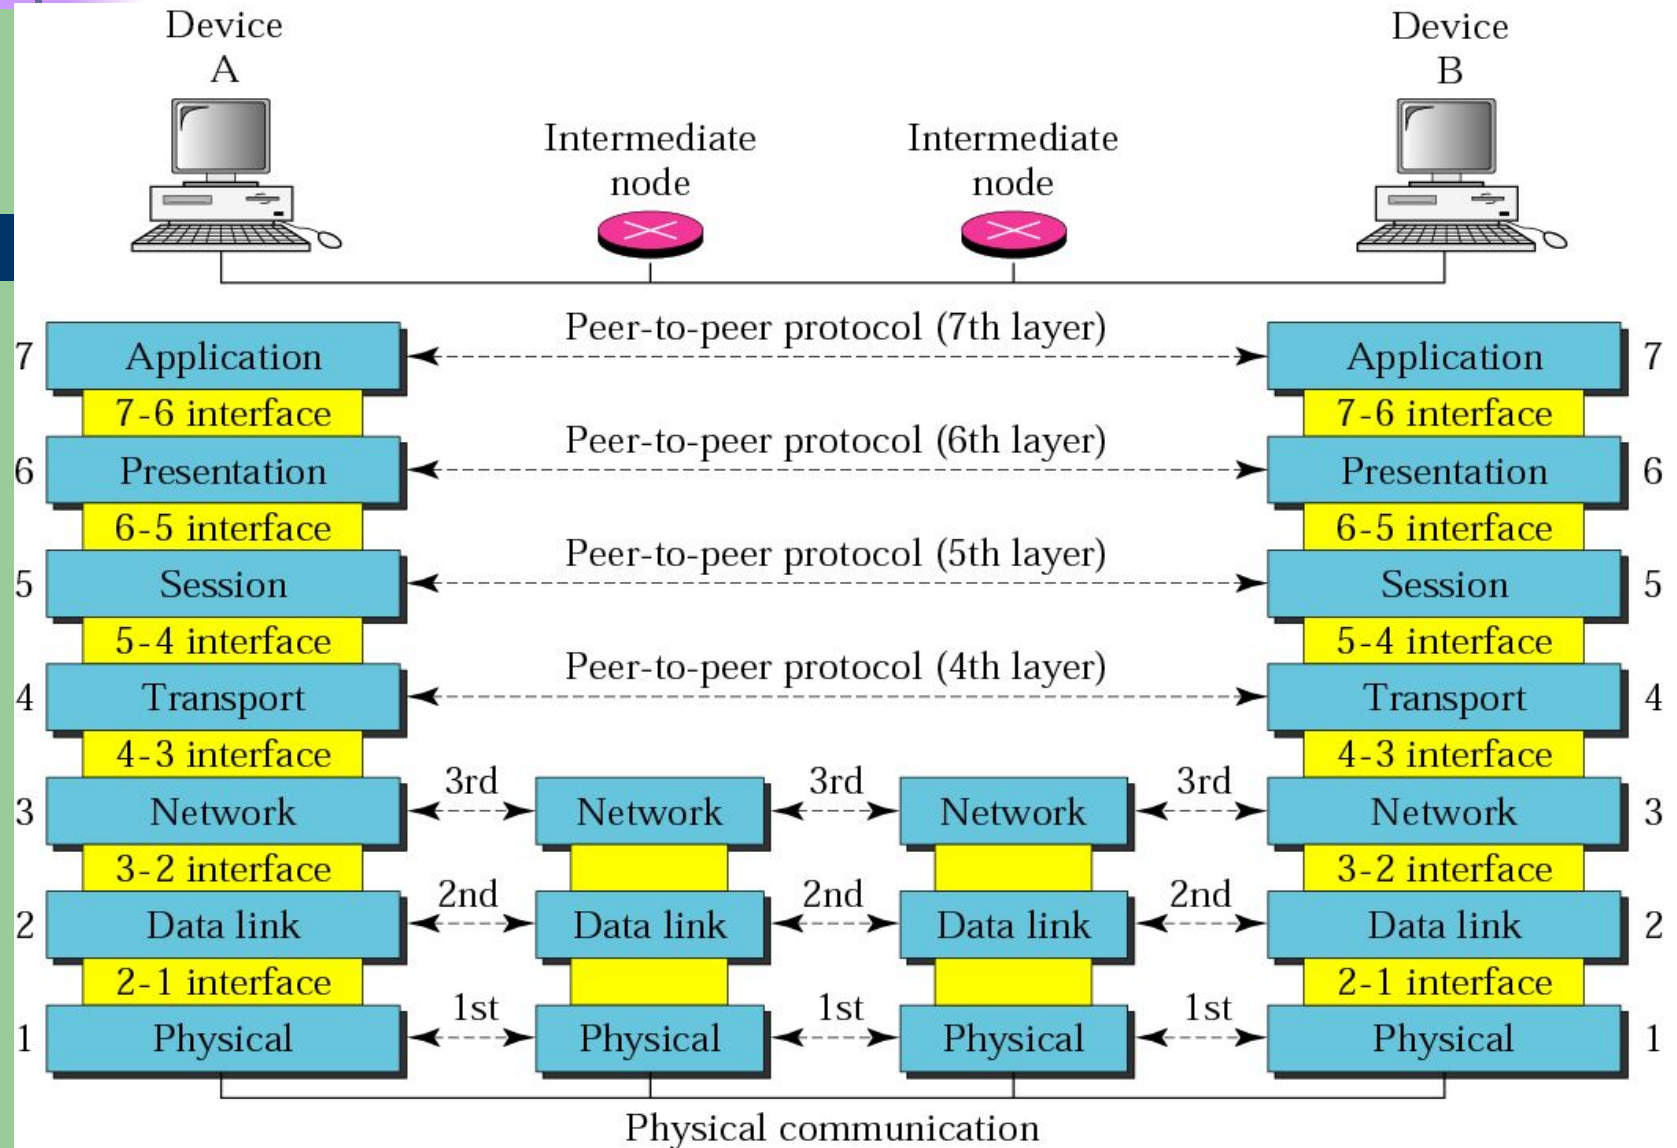

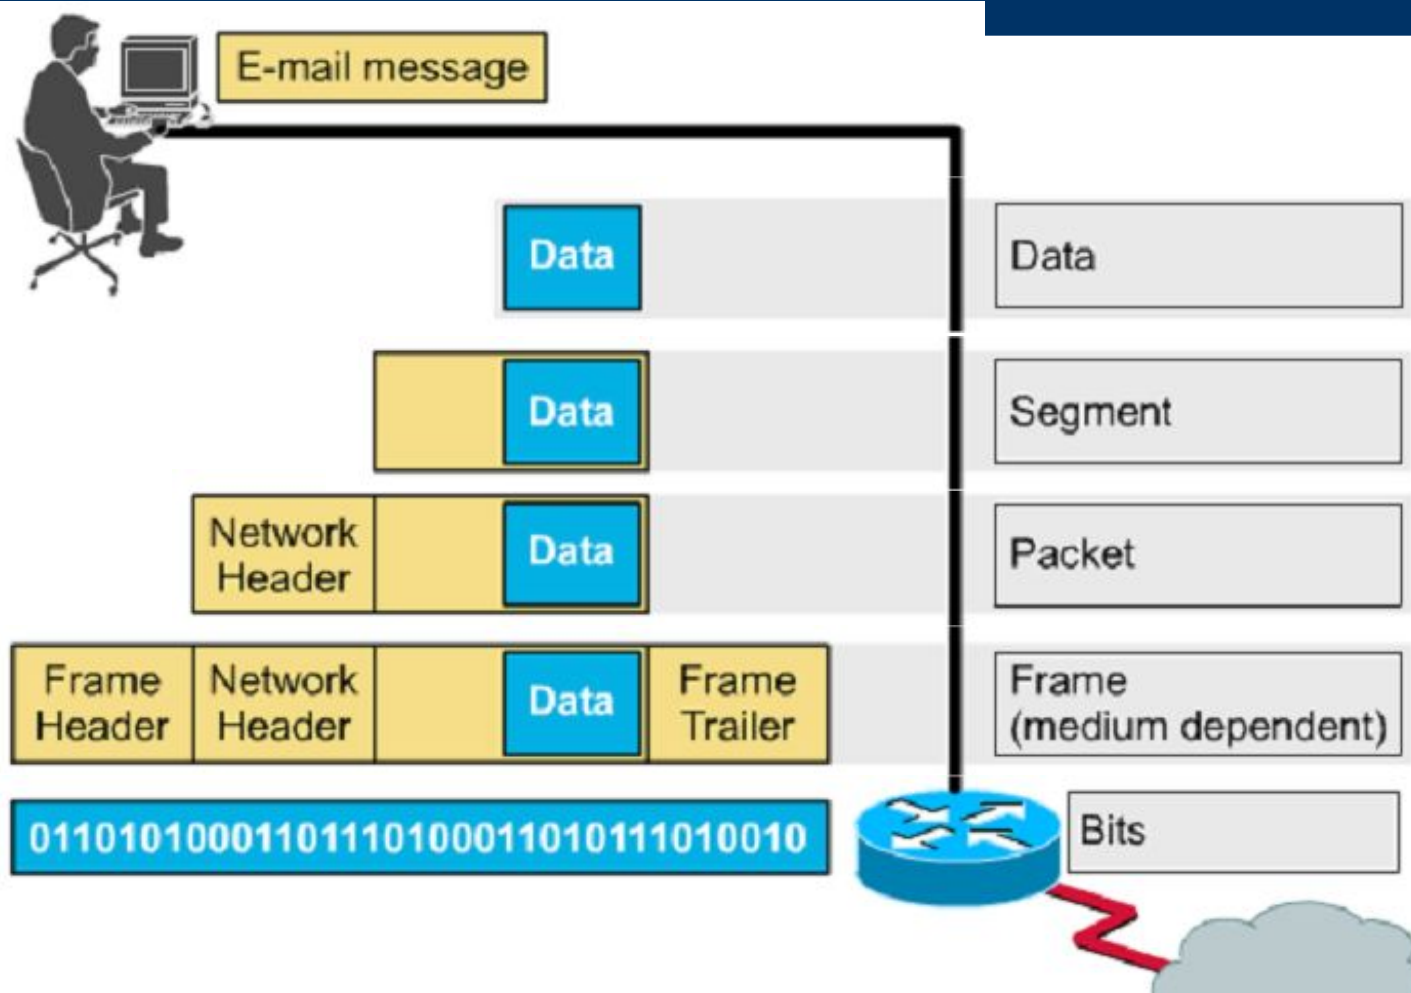

Figure 2.2 *OSI layers*

Data Encapsulation In TCP/IP

- At each layer in the TCP/IP protocol stack
 - Outgoing data is packaged and identified for delivery to the layer underneath
- PDU – Packet Data Unit – the “envelop” information attached to a packet at a particular TCP/IP protocol
 - e.g. header and trailer
- Header
 - PDU’s own particular opening component
 - Identifies the protocol in use, the sender and intended recipient
- Trailer (or packet trailer)
 - Provides data integrity checks for the payload

Encapsulation example: E-mail

Encapsulation

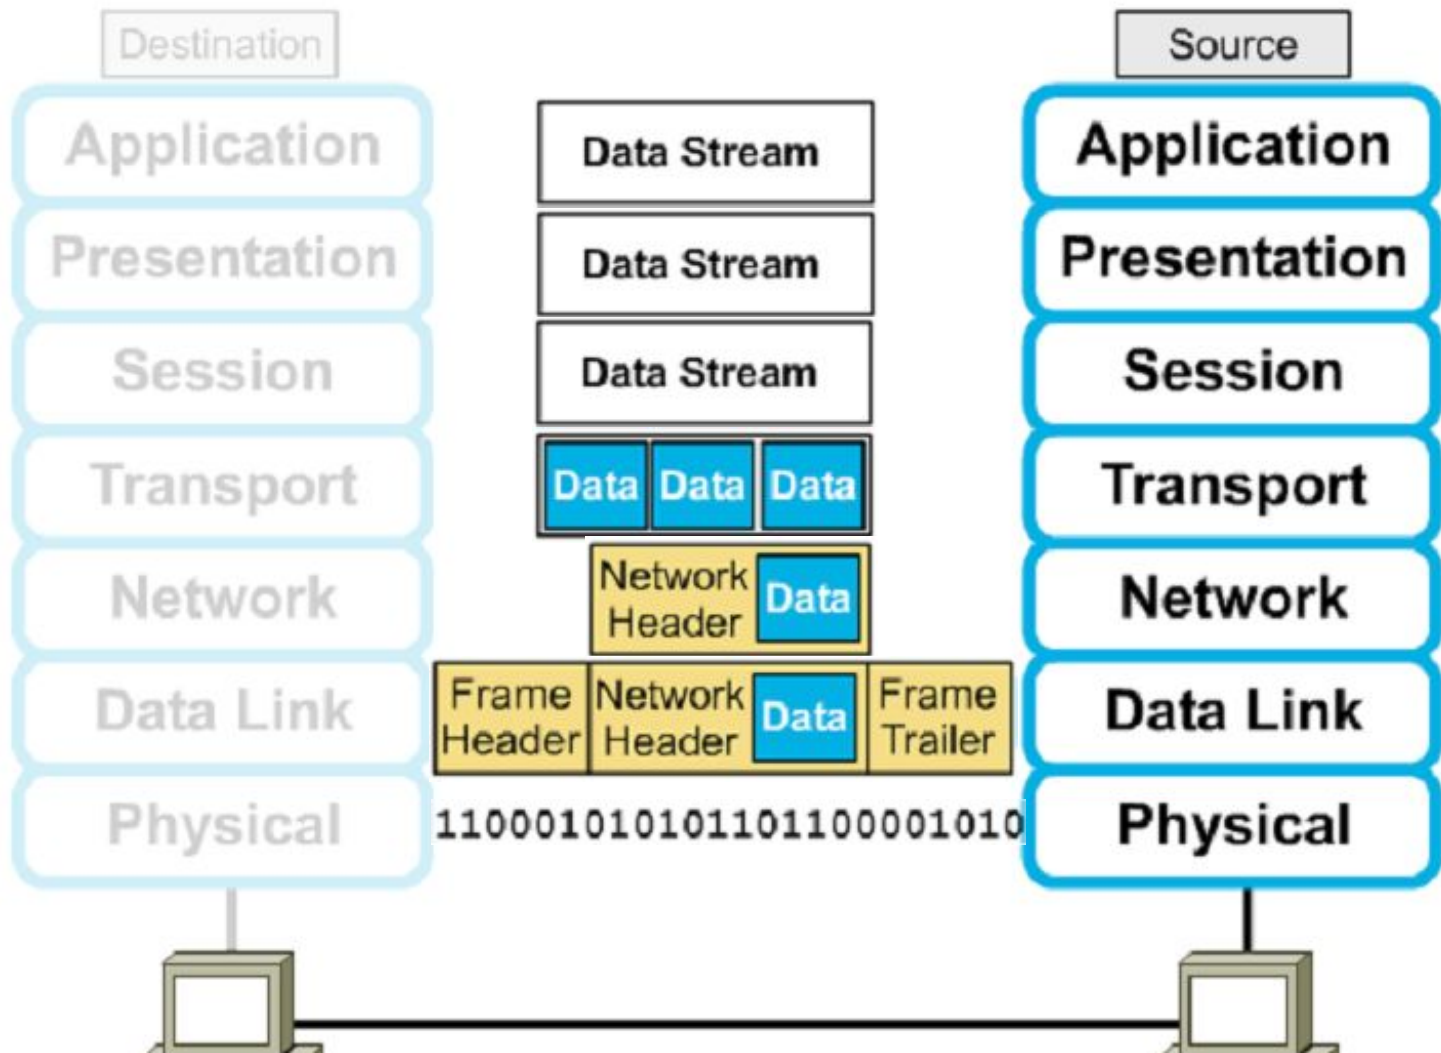

Figure 2.3 *An exchange using the OSI model*

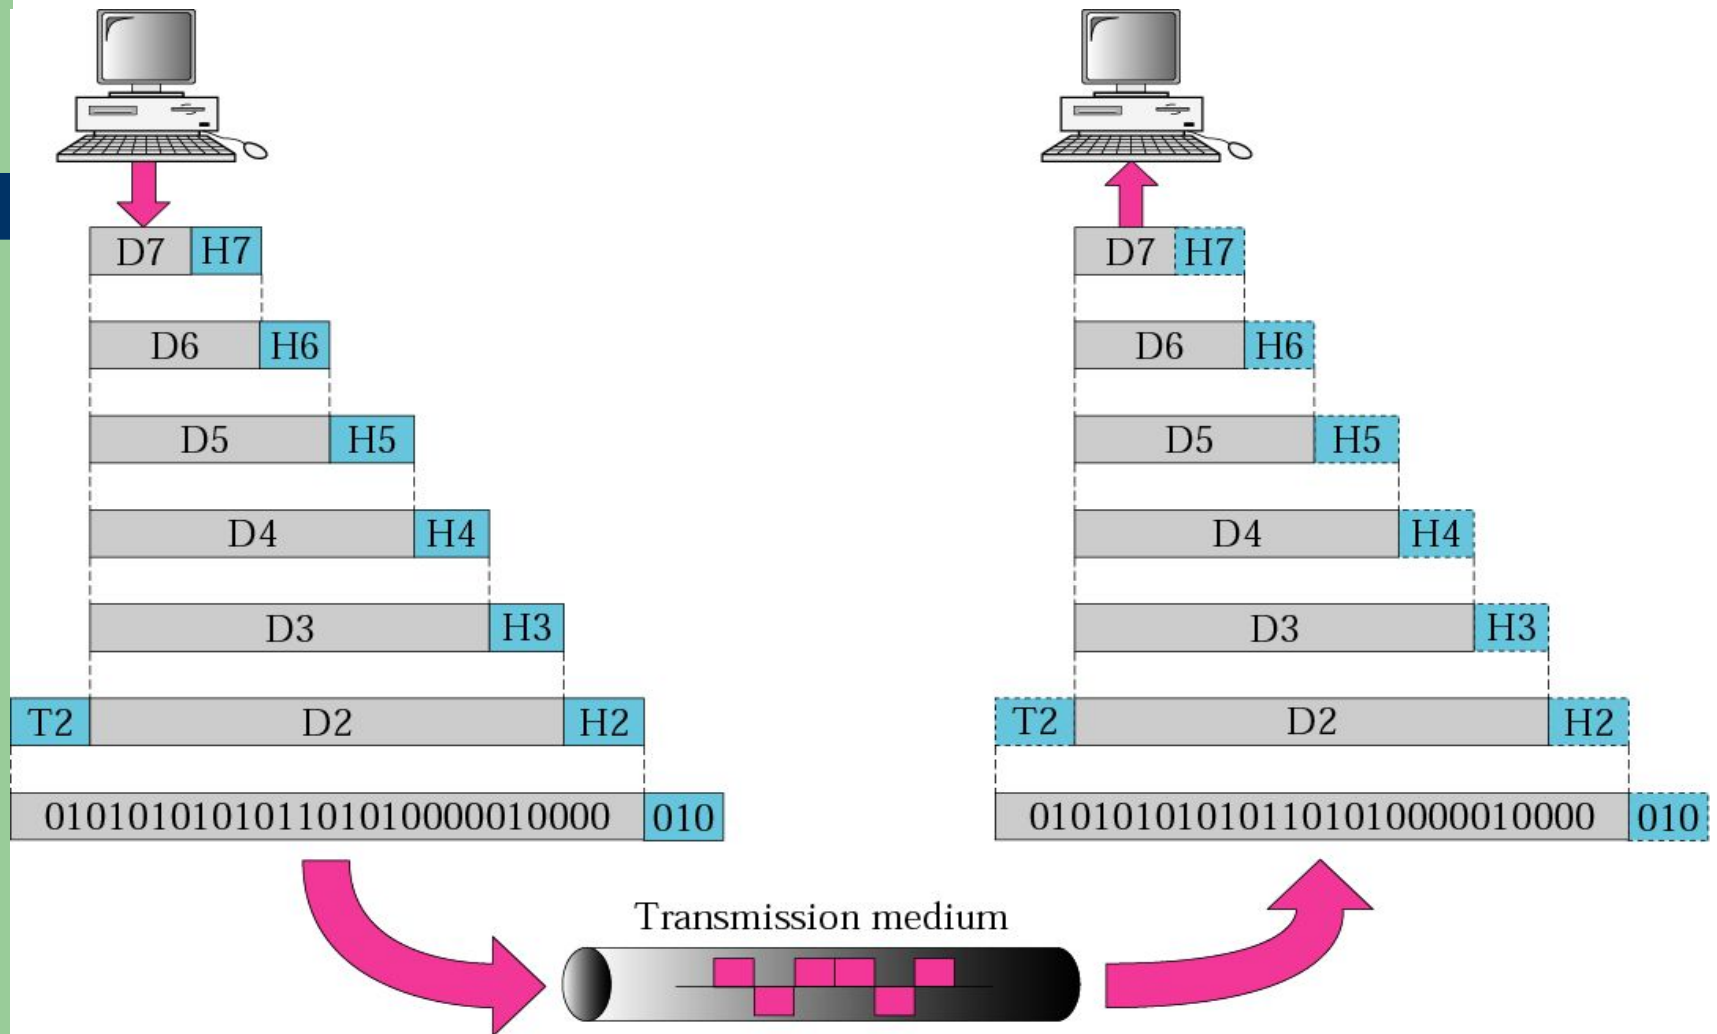

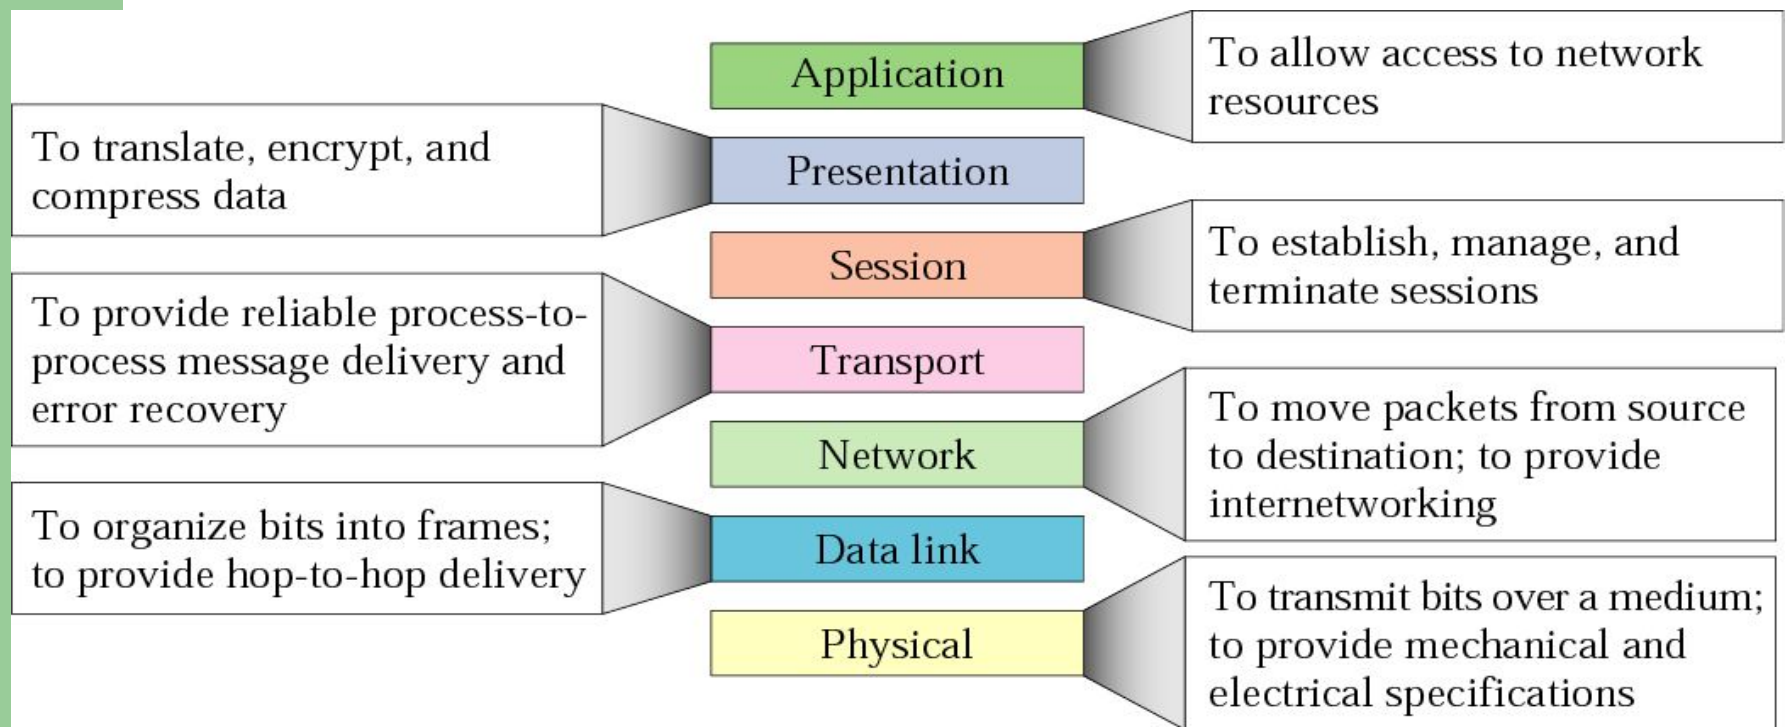

Figure 2.14 *Summary of layers*

The Postal Analogy

How would the OSI compare to the regular Post Office

Application
n

Presentation
n

Session

Transport

Network

Data-Link

Physical

- **A-** Write a 20 page letter to a foreign country.
- **P-** Translate the letter so the receiver can read it.
- **S-** Insure the intended recipient can receive letter.
- **T-** Separate and number pages. Like registered mail, tracks delivery and requests another package if one is “lost” or “damaged” in the mail.
- **N-** Postal Center sorting letters by zip code to route them closer to destination.
- **D-** Local Post Office determining which vehicles to deliver letters.
- **P-** Physical Trucks, Planes, Rail, autos, etc which carry letter between stations.

TCP/IP model development

- The late-60s The Defense Advance Research Projects Agency (DARPA) originally developed **Transmission Control Protocol/Internet Protocol (TCP/IP)** to interconnect various defense department computer networks.
- The Internet, an International Wide Area Network, uses TCP/IP to connect networks across the world.

4 layers of the TCP/IP model

- Layer 4: Application
- Layer 3: Transport
- Layer 2: Internet
- Layer 1: Network access

It is important to note that some of the layers in the TCP/IP model have the same name as layers in the OSI model.

Do not confuse the layers of the two models.

The network access layer

- Concerned with all of the issues that an IP packet requires to actually make the physical link. All the details in the OSI physical and data link layers.
 - Electrical, mechanical, procedural and functional specifications.
 - Data rate, Distances, Physical connector.
 - Frames, physical addressing.
 - Synchronization, flow control, error control.

The internet layer

- Send source packets from any network on the internetwork and have them arrive at the destination independent of the path and networks they took to get there.
 - Packets, Logical addressing.
 - Internet Protocol (IP).
 - Route , routing table, routing protocol.

The transport layer

- The transport layer deals with the quality-of-service issues of reliability, flow control, and error correction.
 - Segments, data stream, datagram.
 - Connection oriented and connectionless.
 - Transmission control protocol (TCP).
 - User datagram protocol (UDP).
 - End-to-end flow control.
 - Error detection and recovery.

TCP/IP Reference Model (cont)

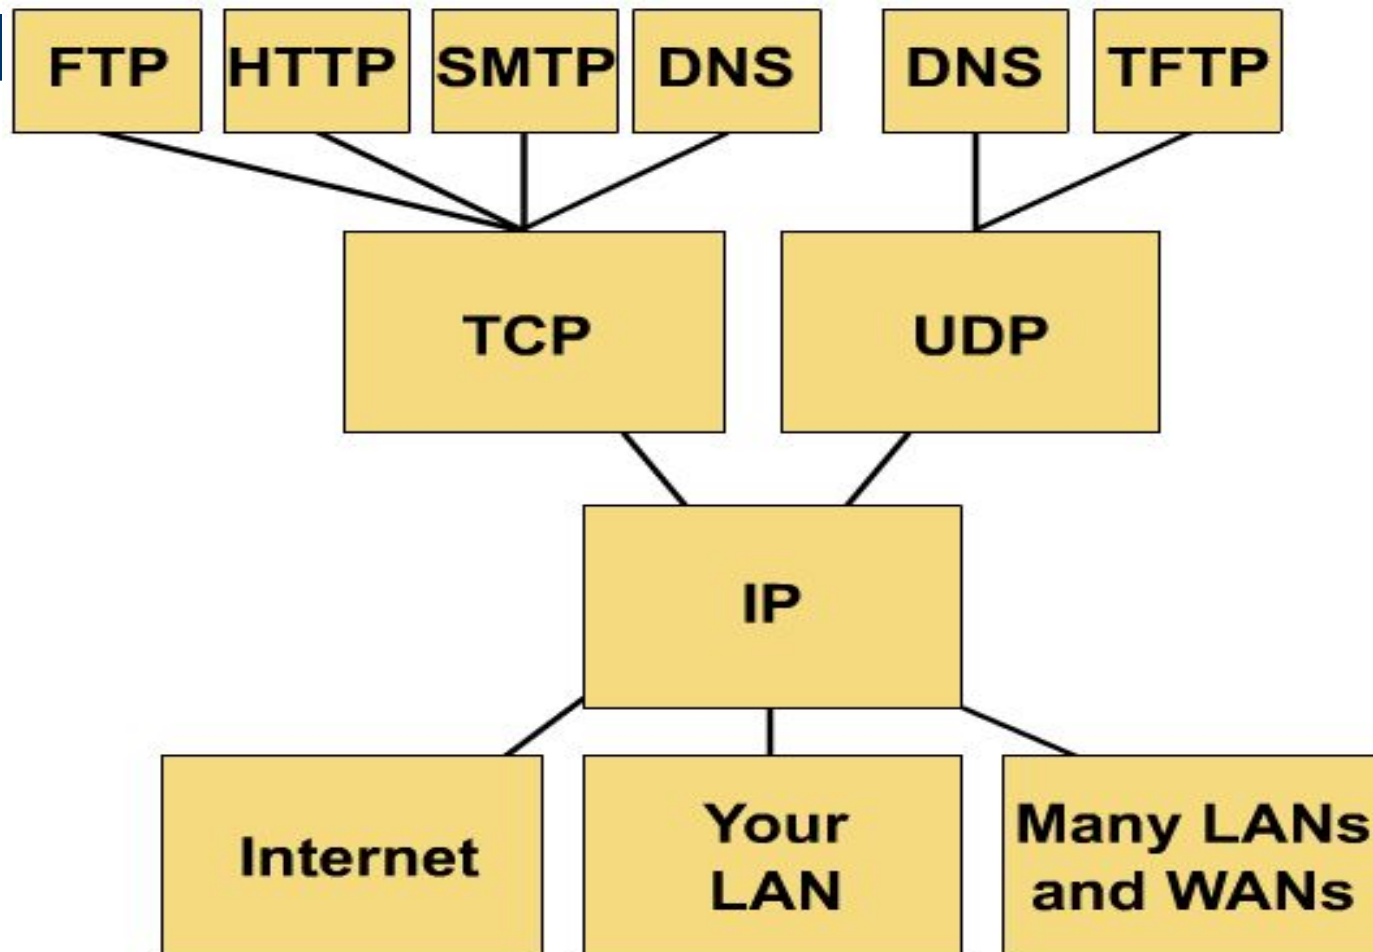

- 3. Transport layer (layer 3)
 - Allows end-to-end communication
 - Connection establishment, error control, flow control
 - Two main protocols at this level
 - Transmission control protocol (TCP),
 - Connection oriented
 - Connection established before sending data
 - Reliable
 - user datagram protocol (UDP)
 - Connectionless
 - Sending data without establishing connection
 - Fast but unreliable

-

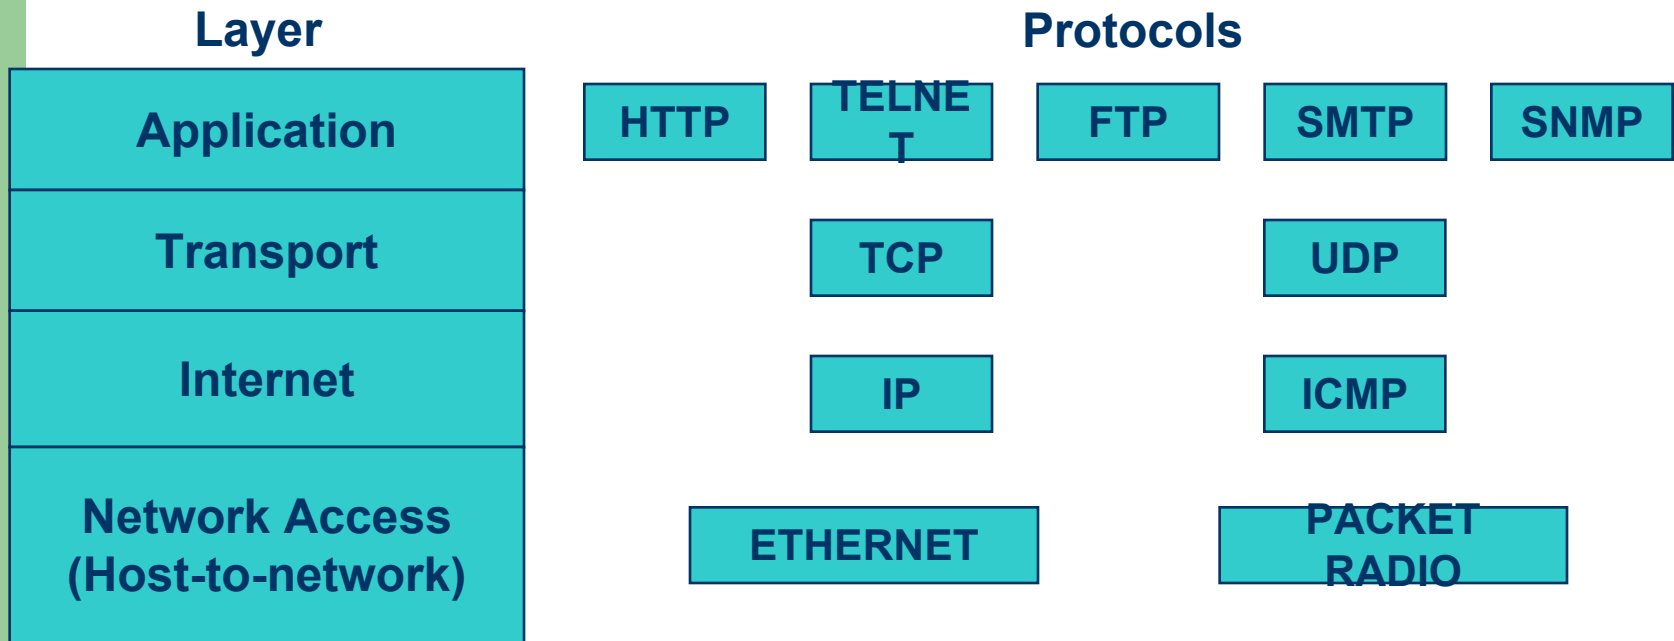

The application layer

- Handles high-level protocols, issues of representation, encoding, and dialog control.
- The TCP/IP combines all application-related issues into one layer, and assures this data is properly packaged for the next layer.
 - FTP, HTTP, SMNP, DNS ...
 - Format of data, data structure, encode ...
 - Dialog control, session management ...

TCP/IP protocol stack

TCP/IP Reference Model

Protocols at the application layer

- HTTP:
 - browser and web server communication
- FTP :
 - file transfer protocol
- TELNET:
 - remote login protocol
- POP3: Retrieve email
 - POP3 is designed to delete mail on the server as soon as the user has downloaded it
- IMAP (Internet Message Access Protocol)
 - Retrieve emails,
 - retaining e-mail on the server and for organizing it in folders on the server

Protocols at the transport layer

- Transmission control protocol (TCP),
 - Connection oriented
 - Connection established before sending data
 - Reliable
- user datagram protocol (UDP)
 - Connectionless
 - Sending data without establishing connection
 - Fast but unreliable

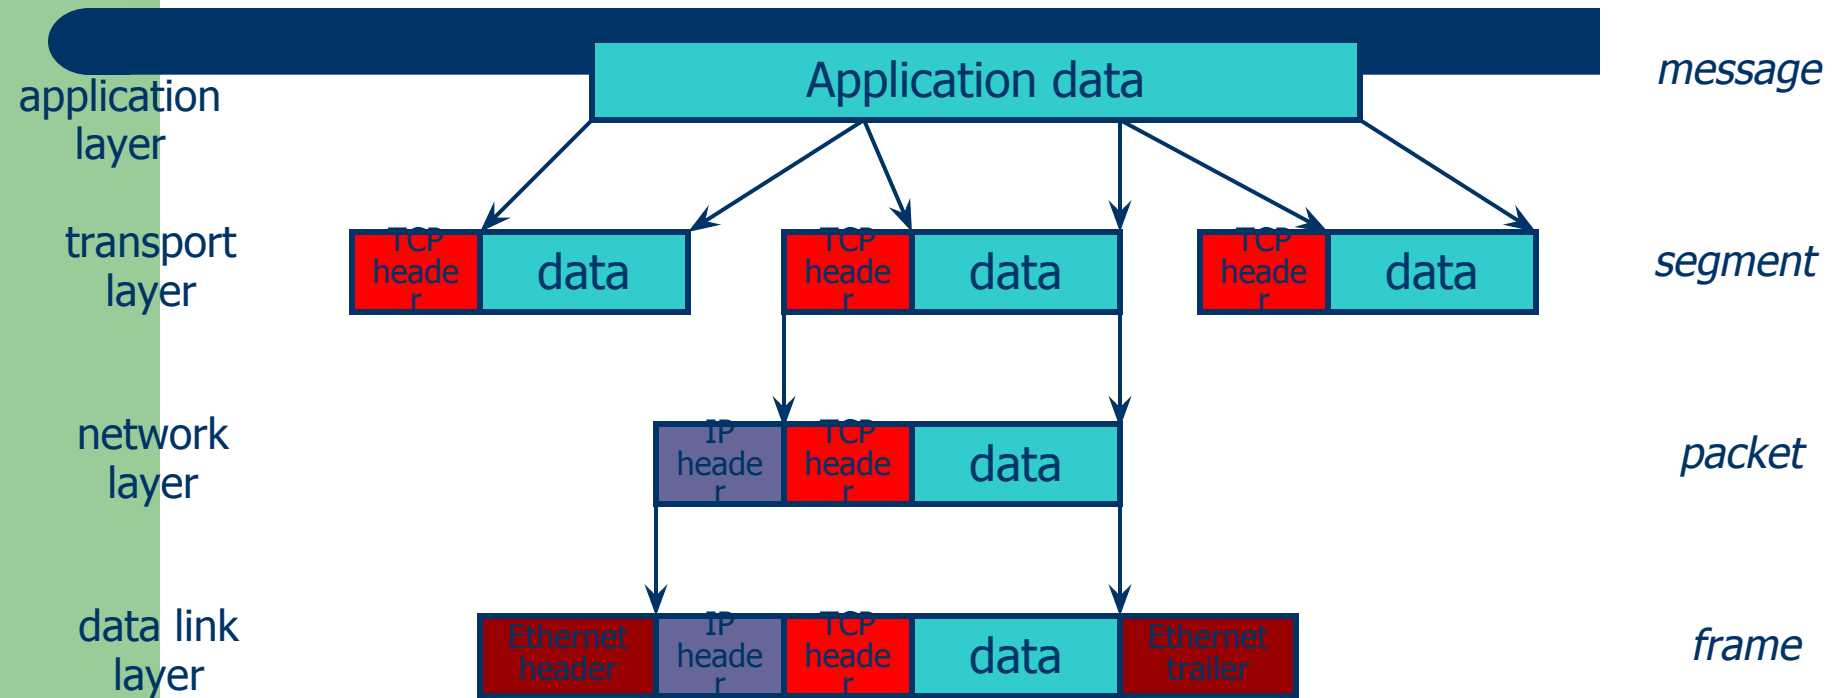

Protocol at the network layer

- IP
 - Path selection ,
 - routing and addressing
- ICMP (Internet Control Message Protocol)
 - sends error messages relying on IP
 - a requested service is not available
 - a host or router could not be reached

Protocols at the link layer

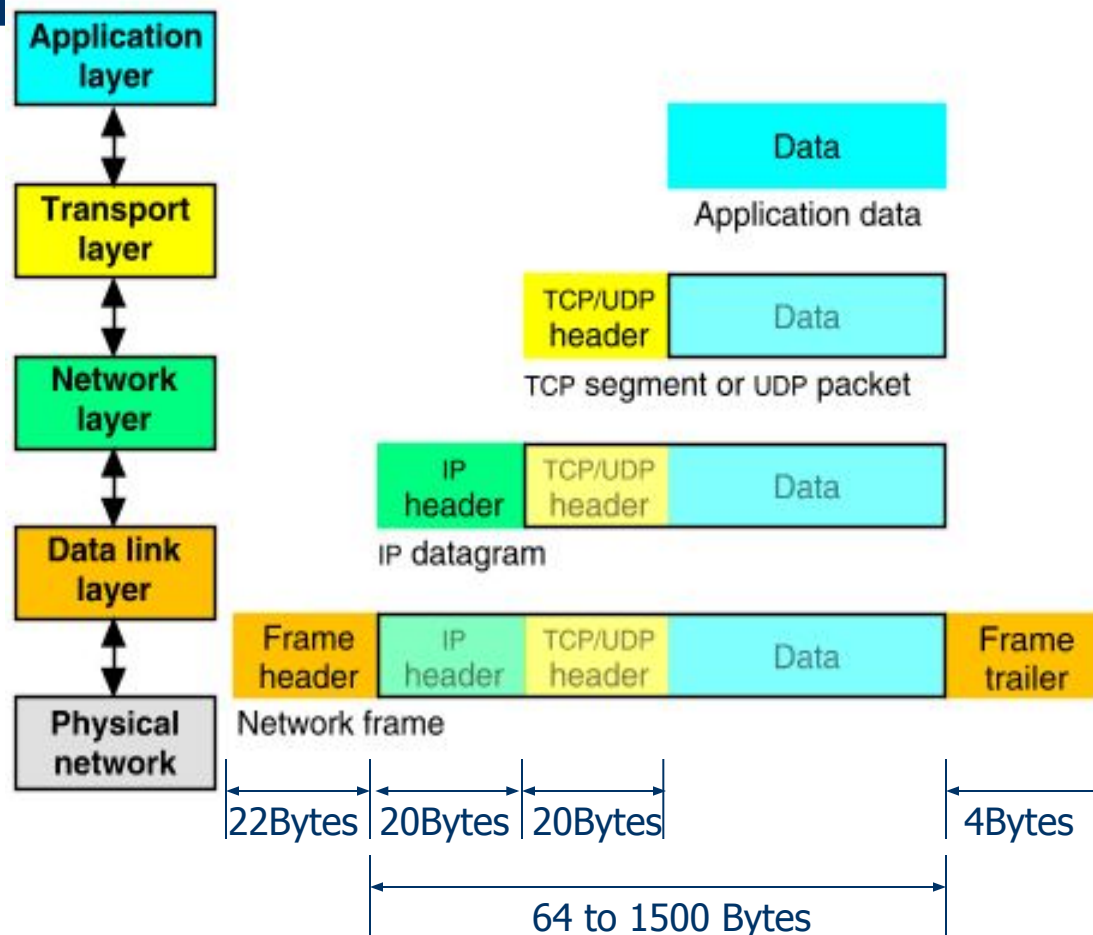

- Ethernet
 - Uses CSMA/CD
- Token Ring

Data Formats

Packet Encapsulation (TCP/IP)

- The data is sent down the protocol stack
- Each layer adds to the data by prepending headers

Comparing TCP/IP with OSI

OSI Model	TCP/IP Hierarchy	Protocols				
7 th Application Layer	Application Layer	HTTP	SMTP	POP3	FTP	...
6 th Presentation Layer						
5 th Session Layer						
4 th Transport Layer	Transport Layer	TCP		UDP		
3 rd Network Layer	Network Layer	IP				ICMP
2 nd Link Layer	Link Layer	ARP RARP		PPP	...	
1 st Physical Layer		Ethernet				

Link Layer : includes device driver and network interface card

Network Layer : handles the movement of packets, i.e. Routing

Transport Layer : provides a reliable flow of data between two hosts

Application Layer : handles the details of the particular application

How the OSI and TCP/IP Models Relate in a Networking Environment

OSI Model Layer	OSI Model Name	Pneumonic	Equipment	Equipment Purpose	Data	Protocols	Words to Remember	TCP/IP Model
Layer 7	Application	All	Computer	Regular Computer or A Special Gateway. Used to combine networks using different communication protocols	Data	Redirector, FTP, Telnet, SMTP, SNMP, Netware Core	Browsers	Application
Layer 6	Presentation	People					Common Data Format	Application
Layer 5	Session	Seem					Dialogues and Conversations	Application
Layer 4	Transport	To	Computer		Segment	TCP and UDP	Quality of Service, and Reliability	Transport
Layer 3	Network	Need	Router	Segment Network into Smaller Broadcast Domains	Packet	Routable Protocols. (IP, IPX, AppleTalk)	Path Selection, Routing, and Addressing	Internet
Layer 2	Data Link -MAC -LLC	Data	Bridge (2 Ports) or Switch and NIC	Segment Network into Smaller Collision Domains	Frame	NDIS, ODI, MAC Address, Ether Talk	Frames and Media Access Control (MAC)	Network Access
Layer 1	Physical	Processing	Repeater, Hub (Multi-port), Cabling	One Collision AND One Broadcast Domain	Bit	Physical	Signals and Media	Network Access

Internet applications

- TCP/IP takes care of the hard problems
 - Location of the destination host
 - Making sure the data is received in the correct order and error free
- Coding Internet applications
 - Turns out to be straightforward.
- The key concept of Internet programming is
 - The client-server model

Ports

- r Each host has 65,536 ports
 - r 20,21: FTP
 - r 23: Telnet
 - r 80: HTTP
- r A socket provides an interface to send data to/from the network through a port
